

---

A plugin for Adobe's After Effects, keyframe animation (also called pose to pose) is a relatively simple animation technique. It can be performed by animating "keyframes." Each set of keyframes in the animation represents one frame in the film. The first set of frames are traditionally called "pose to pose" - this sets up what will happen in the scene without showing any action. The second set of frames are typically referred to as "in between" or "interpolated," which show the action taking place over time between poses. Many animators use either keyframe animation or pose to pose techniques for their animations. Some choose to combine the two methods to create complex animations that utilize both interpolation and keyframes. This combination is commonly referred to as tween animation. This animation was achieved by animating "keyframes." The following video shows the process of creating a walk cycle in keyframe animation using Adobe's After Effects. The video provides an in-depth overview of how shape tweening works in After Effects, particularly when used with eases, which are shown in step 6 of the video.
